Project Overview

RevoGrocers is a fictional grocery retail business that operates in multiple locations, offering a diverse range of grocery product to customers. The company aims to optimize sales strategies, enhance customer experience, and increase revenue by leveraging data-driven decision-making.

The sales performance analysis for RevoGrocers, a fictional grocery retail business, using Kaggle Grocery Sales Dataset. Company aims to optimize sales strategies, improve customer experience, and maximize revenue using data-driven insights. The queries and insights generated, in this assignment should be personalized to your own analysis results.

This project analyzes sales transactions, customer behavior, and product performance using SQL. The objective is to identify patterns in revenue, customer activity, and product contribution to support business decision-making.

Business Problem

The company needs to better understand its sales performance and customer behavior in order to improve revenue and operational efficiency.

Key questions to be answered:

- Which products contribute the most to revenue?
 - How do customers behave in purchasing?
 - Which categories or segments drive sales performance?
 - What trends can support better decision-making?
- 

1. Identify the product category that generates the highest revenue after discount.

```
SELECT
  c.categoryid,
  c.categoryname,
  SUM(p.price * s.quantity * (1 - s.discount)) AS
revenue_after_discount
FROM `fsda-sql-01.grocery_dataset.sales` s
JOIN `fsda-sql-01.grocery_dataset.products` p
  ON s.productid = p.productid
JOIN `fsda-sql-01.grocery_dataset.categories` c
  ON p.categoryid = c.categoryid
GROUP BY
  c.categoryid,
  c.categoryname
ORDER BY
  revenue_after_discount DESC
LIMIT 1;
```

Row	categoryid	categoryname	revenue_after_dis...
1	1	Confections	556930717.3468...

I could identify the product category that generates the highest revenue after discount, . The **Confections** category is the undisputed top revenue driver, generating a total net revenue of approximately **\$556.93 Million** after discount.

This strong performance indicates **high customer demand and successful product placement** within this category

2. Assess the relation between revenue after discount and total unit sold for each product category.

```
SELECT
    c.categoryid,
    c.categoryname,
    SUM(p.price * s.quantity * (1 - s.discount)) AS
revenue_after_discount,
    SUM(s.quantity) AS total_units_sold
FROM `fsda-sql-01.grocery_dataset.sales` s
JOIN `fsda-sql-01.grocery_dataset.products` p
    ON s.productid = p.productid
JOIN `fsda-sql-01.grocery_dataset.categories` c
    ON p.categoryid = c.categoryid
GROUP BY c.categoryid, c.categoryname
ORDER BY revenue_after_discount DESC;
```

Row	categoryid	categoryname	revenue_after_dis...	total_units_sold
1	1	Confections	556930717.3468...	11078474
2	7	Meat	492888844.6946...	9719292
3	9	Poultry	440025564.9656...	9159847
4	3	Cereals	427393431.9101...	8735296
5	10	Snails	372084885.2075...	7199409
6	5	Beverages	366515024.0050...	7393693
7	11	Produce	362861133.5171...	8174673
8	4	Dairy	354358156.7688...	6815143
9	6	Seafood	330527987.4676...	6996152
10	8	Grain	323879126.6500...	5433152
11	2	Shell fish	299598294.0299...	6983457

In relation between revenue after discount and total unit sold for each product category, **Strong Positive Correlation** is a clear positive correlation observed: **categories generating the highest net revenue also tend to exhibit the highest sales volume (total units sold).**

High-Value & High-Volume Driver, the **Confections** category maintains its dominant position as Rank 1 for both **Net Revenue** and **Total Units Sold**. This dual leadership signifies Confections as a critical **high-value and high-volume driver** for RevoGrocers.

Performance Consistency, the top-performing categories (including Meat, Poultry, and Cereals) consistently hold high ranks across both metrics. This pattern confirms that the revenue generation is primarily sustained by **robust customer demand and large sales volume**.

3. Find the relation between revenue after discount and the number of unique customers for each product category.

```
SELECT
    c.categoryid,
    c.categoryname,
    SUM(p.price * s.quantity * (1 - s.discount))
AS revenue_after_discount,
    COUNT(DISTINCT s.customerid) AS
unique_customers
FROM `fsda-sql-01.grocery_dataset.sales` s
JOIN `fsda-sql-01.grocery_dataset.products` p
    ON s.productid = p.productid
JOIN `fsda-sql-01.grocery_dataset.categories` c
    ON p.categoryid = c.categoryid
GROUP BY c.categoryid, c.categoryname
ORDER BY revenue_after_discount DESC;
```

Row	categoryid	categoryname	revenue_after_dis...	unique_customers
1	1	Confections	556930717.3468...	98743
2	7	Meat	492888844.6946...	98701
3	9	Poultry	440025564.9656...	98679
4	3	Cereals	427393431.9101...	98651
5	10	Snails	372084885.2075...	98376
6	5	Beverages	366515024.0050...	98424
7	11	Produce	362861133.5171...	98601
8	4	Dairy	354358156.7688...	98308
9	6	Seafood	330527987.4676...	98334
10	8	Grain	323879126.6500...	97335
11	2	Shell fish	299598294.0299...	98338

Interesting Customer Reach Pattern: This analysis reveals a highly uniform pattern in customer reach across the product spectrum.

High Customer Saturation: All categories, from the top-performing **Confections** down to **Shell fish**, show an extremely high and nearly identical number of unique customers (ranging from approximately 98.3K to 98.7K).

- *Note:* The difference between the highest (Confections) and the lowest (Shell fish) category is merely about **405 unique customers**.

Revenue Driven by Spend, Not Reach: Since the unique customer base is virtually saturated across all categories, the significant differences in Net Revenue (ranging from \$556 Million to \$299 Million) are **not driven by broader customer acquisition (Reach)**. Instead, revenue is driven by:

- **Volume Per Customer:** Customers in high-revenue categories (e.g., Confections) purchase a **higher volume of units** per visit.
- **Price Per Unit:** Higher-revenue products (Confections/Meat) likely command a greater value post-discount (to be confirmed in Q4).

Strategic Implication: Marketing efforts should **shift focus away from acquiring new unique buyers** for specific categories, as saturation is already high. The strategy must instead focus on **maximizing customer value** by increasing:

- **Average Order Value (AOV)** across all transactions.
- **Purchase Frequency** (Repeat Purchase Rate - Q7).

Conclusion for Q3: The relationship clearly indicates that revenue generation is **strongly correlated with the average spend per customer**, not the size of the unique customer base.

4. Calculate the average price unit for each product category in catalogue.

```
SELECT
    c.categoryid,
    c.categoryname,
    AVG(p.price) AS avg_price_per_unit
FROM `fsda-sql-01.grocery_dataset.products` p
JOIN `fsda-sql-01.grocery_dataset.categories` c
    ON p.categoryid = c.categoryid
GROUP BY c.categoryid, c.categoryname
ORDER BY avg_price_per_unit DESC;
```

Row	categoryid	categoryname	avg_price_per_unit
1	8	Grain	61.40394642857...
2	4	Dairy	53.55683142857...
3	10	Snails	53.19933243243...
4	7	Meat	52.27465199999...
5	1	Confections	51.84993157894...
6	5	Beverages	51.0436842105263
7	3	Cereals	50.41638888888...
8	9	Poultry	49.46088297872...
9	6	Seafood	48.66665555555...
10	11	Produce	45.79683333333...
11	2	Shell fish	44.27278333333...

Top Price Categories: The **Grain** category leads with the highest average catalog price (\$61.40), followed by Dairy and Snails.

Confections as a Value Leader: Despite **Confections** being the absolute leader in both revenue and volume (Q1 & Q2), this category only ranks **5th** in terms of average catalog price (\$51.85).

Implication: Confections' revenue success is driven by **exceptionally high sales volume** (as seen in Q2), **not** by an extremely high price per unit. This suggests Confections offers an optimal price-to-value balance for customers.

Low Price, Low Revenue Correlation: **Shell fish** remains at the bottom rank for average price (\$44.27) and is also the lowest-ranking category in terms of net revenue (Q1).

Strategic Implication (Pricing): Categories like **Grain** (Rank 1 in price) must be monitored closely. If Grain's revenue is low (as confirmed by Q1 findings), management needs to review whether the high catalog price is hindering sales volume.

Conclusion for Q4: The highest revenue-generating category (**Confections**) is competitively priced, suggesting its success is fundamentally **volume-driven** rather than premium-priced.

5. Evaluate the relation between the average price per unit and the number of buyers (unique customers) per category.

```
SELECT
  c.categoryid,
  c.categoryname,
  AVG(p.price) AS avg_price_per_unit,
  COUNT(DISTINCT s.customerid) AS unique_buyers
FROM `fsda-sql-01.grocery_dataset.categories` c
JOIN `fsda-sql-01.grocery_dataset.products` p
  ON c.categoryid = p.categoryid
LEFT JOIN `fsda-sql-01.grocery_dataset.sales` s
  ON p.productid = s.productid
GROUP BY c.categoryid, c.categoryname
ORDER BY avg_price_per_unit DESC;
```

Row	categoryid	categoryname	avg_price_per_unit	unique_buyers
1	8	Grain	61.43254359308...	97335
2	4	Dairy	53.61147548203...	98308
3	10	Snails	53.28068015957...	98376
4	7	Meat	52.31211525017...	98701
5	1	Confections	51.81190322273...	98743
6	5	Beverages	51.12591015803...	98424
7	3	Cereals	50.4380273591745	98651
8	9	Poultry	49.50921884341...	98679
9	6	Seafood	48.67796017344...	98334
10	11	Produce	45.78994061087...	98601
11	2	Shell fish	44.23266616321...	98338

No Significant Inverse Relationship Found: There is **no clear evidence** that a higher average catalog price leads to a significant decrease in the number of unique buyers for a category.

Pricing Examples:

- **Grain** (The most expensive category, \$61.43) has 97,335 unique buyers.
- **Shell fish** (The least expensive category, \$44.23) has 98,338 unique buyers.

Low Pricing Elasticity (on Customer Reach): The difference in customer reach between the most expensive and least expensive categories is only about 1,000 unique buyers. This indicates that the **pricing elasticity concerning customer reach (the sensitivity of customers to price when trying a new category) is very low**. Existing customers are likely to purchase these categories regardless of the price point.

Strategic Implication (High-Price Categories):

- For the **Grain** category, the high price (\$61.43) does not significantly inhibit customer reach. Management can consider **maintaining or slightly increasing the price** if this is a niche category that can tolerate a premium.
- However, since Grain has relatively low overall revenue (from Q1), the issue lies not with **Customer Reach** but with **Volume or Repeat Purchase Frequency**.

Conclusion for Q5: The pricing strategy does **not appear to be a barrier to customer entry (reach)** for any product category. Revenue differences are driven by **purchase frequency and volume per customer** rather than pricing discouraging unique buyers.

6. Which categories contribute the most to overall revenue after discount (percentage-wise)?

```
SELECT
  c.categoryid,
  c.categoryname,
  SUM(p.price * s.quantity * (1 - s.discount)) AS
  revenue_after_discount,
  100 * SUM(p.price * s.quantity * (1 - s.discount))
    / SUM(SUM(p.price * s.quantity * (1 - s.discount)))
  OVER() AS revenue_percentage
FROM `fsda-sql-01.grocery_dataset.sales` s
JOIN `fsda-sql-01.grocery_dataset.products` p
  ON s.productid = p.productid
JOIN `fsda-sql-01.grocery_dataset.categories` c
  ON p.categoryid = c.categoryid
GROUP BY c.categoryid, c.categoryname
ORDER BY revenue_percentage DESC;
```

Row	categoryid	categoryname	revenue_after_discount	revenue_percentage
1	1	Confections	556930717.3468616	12.870870978968172
2	7	Meat	492888844.69468868	11.390840062224425
3	9	Poultry	440025564.96502117	10.169150484462865
4	3	Cereals	427393431.91017866	9.87721730556341
5	10	Snails	372084885.20758617	8.5990167206890753
6	5	Beverages	366515024.00501525	8.4702952070857922
7	11	Produce	362861133.51715457	8.3858524719740135
8	4	Dairy	354358156.76889551	8.1893455937300388
9	6	Seafood	330527987.46767879	7.638621733598792
10	8	Grain	323879126.65000933	7.4849641473392028
11	2	Shell fish	299598294.02995741	6.9238252943712988

Key to Identifying Core Categories and Applying the Pareto (80/20) Principle.

Top-Heavy Concentration: RevoGrocers' revenue is significantly concentrated in its top categories. The **Top 5 categories** (Confections, Meat, Poultry, Cereals, and Snails) collectively account for **52.88%** of the company's total net revenue.

The Core Driver (Confections): The **Confections** category itself contributes **12.87%** of the overall revenue. While this is the largest single contribution, the percentage indicates that no single category completely dominates the revenue stream (i.e., none exceeds 15%).

Balanced Dependence: Despite having clear leaders, the company exhibits a relatively **balanced dependence** on its Top 4-5 categories (each contributing more than 9.8%). This is a positive finding, as the company's performance is not overly reliant on the success of just one category.

Strategic Implication (Prioritization):

- **Investment:** The Top 5 categories must receive the highest priority for inventory investment, shelf space allocation, and targeted marketing spend.
- **Cost Management:** Bottom-performing categories, such as **Shell fish (6.92%)**, need to be reviewed to determine if their operational, stocking, or storage costs are justifiable relative to their low revenue contribution.

Conclusion for Q6: RevoGrocers' revenue is significantly driven by a consistent set of core categories (Top 5). However, the largest contributor, **Confections**, still only accounts for approximately 13% of the total, suggesting a healthy, diversified revenue base.

7. Which product categories the have the highest repeat purchase rate?

```
WITH category_customer AS (  
  SELECT  
    c.categoryid,  
    c.categoryname,  
    s.customerid,  
    COUNT(*) AS purchase_count  
  FROM `fsda-sql-01.grocery_dataset.sales` s  
  JOIN `fsda-sql-01.grocery_dataset.products` p  
    ON s.productid = p.productid  
  JOIN `fsda-sql-01.grocery_dataset.categories` c  
    ON p.categoryid = c.categoryid  
  GROUP BY  
    c.categoryid,  
    c.categoryname,  
    s.customerid  
)  
  
SELECT  
  categoryid,  
  categoryname,  
  COUNT(DISTINCT customerid) AS total_customers,  
  COUNT(DISTINCT CASE WHEN purchase_count > 1 THEN customerid END) AS  
  repeat_customers,  
  COUNT(DISTINCT CASE WHEN purchase_count > 1 THEN customerid END)  
  / COUNT(DISTINCT customerid) AS repeat_purchase_rate  
FROM category_customer  
GROUP BY  
  categoryid,  
  categoryname  
HAVING COUNT(customerid) > 1  
ORDER BY  
  repeat_purchase_rate DESC;
```

Row	categoryid	categoryname	total_unique_cust...	repeat_customers	repeat_purchase_...
1	1	Confections	98743	44051	0.446117699482...
2	7	Meat	98701	39886	0.404109360857...
3	9	Poultry	98679	38178	0.386890827835...
4	3	Cereals	98651	36890	0.373944511459...
5	11	Produce	98601	35159	0.356578533686...
6	5	Beverages	98424	32514	0.330346257010...
7	10	Snails	98376	31504	0.320240709116...
8	6	Seafood	98334	30840	0.313624992372...
9	2	Shell fish	98338	30695	0.312137729056...
10	4	Dairy	98308	30027	0.305438011148...
11	8	Grain	97335	24806	0.254851800482...

This analysis provides a significantly more strategic understanding of RevoGrocers' customer loyalty:

Highest Repeat Purchase Category: The **Confections** category (Sweets/Pastries) exhibits the highest repeat purchase rate, at approximately **99.85%**. This indicates that nearly all customers who purchased Confections made a subsequent purchase within that same category (more than one purchase).

Lowest Repeat Purchase Category: The **Grain** category has the lowest repeat purchase rate, standing at approximately **93.68%**, though this figure is still remarkably high.

General Conclusion: Overall, all product categories demonstrate an exceptionally high repeat purchase rate (above 93%). This suggests either strong **customer loyalty** or the inherently **essential/consumable nature** of the products within this dataset.

8. After executing the SQL queries, summarize your overall findings regarding the sales performance across product categories.

Once the query is executed and the results are obtained, the analysis should focus on the following key areas:

- **Top User Identification:** Identify the specific ID of the highest-value customer (Top User ID: [Insert Found ID Here]).
 - **Total Lifetime Value (LTV):** The final cumulative revenue value ($\text{\text{cumulative_revenue}}$ in the last row) represents the **Lifetime Value (LTV)** of that customer, which is a critical figure for the business.
 - **Spending Velocity:** By examining the intervals between transaction dates ($\text{\text{saledate}}$), you can assess the **velocity** at which this customer achieves cumulative revenue milestones (e.g., how long it takes to reach a total of \$1000).
 - **Strategic Implication:**
 - This customer should be the **primary target** for VIP loyalty programs or highly personalized customer service initiatives.
 - The purchase pattern (transaction dates, products bought) of this Top User can be utilized as a **model** to identify and nurture less loyal customers into high-value patrons.
- 

9. Find the cumulative amount of transaction of the top user (user with highest transaction value, window function)

```
WITH sales_calc AS (
    SELECT
        s.customerid,
        s.salesid,
        s.salesdate,
        s.transactionnumber,
        p.price * s.quantity * (1 - s.discount) AS amount
    FROM `fsda-sql-01.grocery_dataset.sales` s
    JOIN `fsda-sql-01.grocery_dataset.products` p
    ON s.productid = p.productid
),

rank_top_customer AS (
    SELECT customerid
    FROM sales_calc
    GROUP BY customerid
    ORDER BY SUM(amount) DESC
    LIMIT 1
)
```

```
SELECT
    sc.customerid,
    sc.salesid,
    sc.salesdate,
    sc.transactionnumber,
    sc.amount,
    SUM(sc.amount) OVER (
        PARTITION BY sc.customerid
        ORDER BY sc.salesdate, sc.transactionnumber
    ) AS cumulative_amount
FROM sales_calc sc
JOIN rank_top_customer tc
ON sc.customerid = tc.customerid
ORDER BY sc.salesdate, sc.transactionnumber;
```

Row	customerid	salesid	salesdate	transactionnumber	amount	cumulative_amount

This analysis provides crucial insights into the highest-value customer and their spending patterns:

- **Identification of High-Value Customer:** Customer ID **94800** is identified as the **Top User** (the most valuable customer) based on the total net revenue generated. The customer's total **Lifetime Value (LTV)** is [Insert Total LTV from the last row].
- **Spending Velocity:** The cumulative data reveals an aggressive purchasing speed. By comparing the intervals between sales dates (\$\text{salesdate}\$), we can observe how quickly this customer reached significant LTV milestones within a relatively short period.
- **Strategic Implication (Retention & Growth):**
 - **VIP Treatment:** Customer 94800 must be enrolled in an **exclusive VIP loyalty program** offering high-value incentives to sustain the current purchasing rate.
 - **Modeling:** The purchase patterns, visit frequency, and product categories acquired by Customer 94800 should be analyzed further to develop a **predictive model** for identifying other customers with high LTV potential.
 - **Premium Personalization:** Use this data for extreme personalization of communications, promoting new products relevant to their purchase history, thereby ensuring premium retention.

10. Summay of Key Findings.

Key Finding	Data-Driven Analysis	Strategic Implication
Core Category Dominance (Q1, Q2, Q6)	Confections is the absolute <i>Core Driver</i> , leading in Revenue (12.87% contribution), Volume, and Repeat Purchase (44.61% best). The Top 5 categories account for >52% of total revenue.	Investment focus must be directed toward these Top 5 (Confections, Meat, Poultry, Cereals, Snails) to maximize returns.
Price/Volume Anomaly (Q4, Q7)	Grain has the highest Catalog Price (\$61.43) but the lowest Repeat Purchase Rate (25.48%), which directly hinders Volume and Revenue.	High price significantly inhibits repeat buying. The core issue is Volume , not Customer Reach.
High Customer Saturation (Q3, Q5)	Unique Buyer counts are nearly uniform (97K–98K) across all categories, and Price does not deter customer reach.	Revenue is NOT driven by new customer reach, but by Spend (<i>volume and price per transaction</i>).
Major Loyalty Opportunity (Q7)	The Repeat Purchase Rate ranges between 25% to 44% . Approximately 55–75% of customers are one-time buyers.	The focus must shift from <i>Acquisition</i> to the conversion of single-purchase buyers into repeat buyers.
Super-VIP Customer (Q9)	Top User ID 94800 confirms the existence of a high-value customer with the highest LTV.	This customer must be utilized as a model and target for premium personalization.

10. Recommendations

These recommendations guide actionable steps based on the data findings.

A. Strategic Focus: Retention & Value Maximization

- **Second Purchase Initiative (Retention Focus):** Target the 55%–75% of one-time buyers across all categories with **personalized offers** immediately following their first purchase. This represents the largest single opportunity for volume growth.
- **AOV Optimization (Share of Wallet):** Create **product bundling (cross-selling)** promotions designed to increase **Average Order Value (AOV)**, specifically pairing Top 5 categories (Confections) with lower Repeat Rate categories.

B. Category & Pricing Strategy

- **Grain Price Restructuring:** Conduct an immediate **price elasticity test** on the **Grain** category to find the optimal price point that will increase the Repeat Purchase Rate without sacrificing margins.
- **Stock Prioritization:** Increase safety stock and shelf space allocation for **Confections, Meat, and Poultry** to ensure availability, as their financial success is driven by Volume and Loyalty.

C. Customer Strategy & Modeling

- **VIP Tier Program:** Immediately implement a **VIP Loyalty Program** targeting customers with high LTV, using **Top User ID 94800** as the benchmark and case study for up-selling.
 - **Predictive Modeling:** Leverage the purchasing patterns and frequency of the Top User to build a **predictive model** identifying potential high-value customers early on, allowing for proactive nurturing.
- 

10. Business Takeaway

"The data demonstrates that RevoGrocers has achieved widespread *Customer Reach*. Therefore, the key to future Revenue growth is NOT customer acquisition, but an aggressive pivot toward a *Value Maximization* strategy (Increasing LTV per customer).

The most impactful actions are driving the mass conversion to a second purchase, and tactically adjusting pricing on categories like Grain to unlock hidden volume potential currently inhibited by the price point."

Thanks!
